ExtractKeywords

Free keyword extraction tool for text and URLs, with CSV export and bigram/trigram support.

About

ExtractKeywords is a keyword extraction tool that finds important terms in text or a public URL in seconds. It runs instantly in the browser, needs no signup, and lets you download results as CSV or copy them to the clipboard. The app supports one-word terms as well as bigrams and trigrams, so you can compare single keywords with longer search phrases.

What is ExtractKeywords

ExtractKeywords is a keyword extraction tool built for quick text analysis from either pasted content or a publicly accessible webpage URL. It highlights repeated terms.

can see what a page is really about. The app is designed for fast keyword extraction without account creation, which makes it practical for one-off checks, lightweight research, and SEO review.

The website presents two modes: Text and URL. In URL mode, the tool fetches the page's public HTML, respects robots.txt directives, and then extracts the main text before running the same analysis used for pasted text. That makes ExtractKeywords useful as a keyword extraction tool for webpages, articles, landing pages, and other public content you want to inspect quickly.

Key features

ExtractKeywords focuses on straightforward keyword extraction rather than a broad SEO suite. Its main capabilities are easy to understand and aimed at quick analysis.

- **Text and URL input:** paste content directly or analyze a public webpage address.
- **Instant analysis:** results appear after you click the extract action, with no signup required.
- **Stop-word filtering:** common words such as articles, pronouns, and prepositions are removed so the results stay meaningful.
- **Phrase detection:** the keyword extraction tool identifies 1-word terms plus 2-word bigrams and 3-word trigrams.
- **Sorting by count and density:** results show both how often a term appears and how dense it is in the source text.
- **CSV export:** download the keyword extraction output for spreadsheets or reporting.
- **Clipboard copy:** copy the results if you want to move them into another tool quickly.
- **Language options:** the site interface shows English, [illegible], and [illegible] options.

The interface also includes tabs to filter results by 1-word, 2-word, or 3-word phrases, which helps when you want to compare keyword extraction output by phrase length.

How to use it

Using ExtractKeywords is simple, whether you are checking a draft or running a keyword extraction pass on a live page.

Choose your input type. Open the Text tab for pasted copy, or switch to the URL tab for a webpage.

Enter the content. Paste your text into the field, or add a publicly accessible URL for the keyword extraction tool to crawl.

Run extraction. Click the extract button and wait for the results to load.

Review the table. Check the keyword list, which is organized by frequency and density.

Filter by phrase length. Use the 1-word, 2-word, and 3-word tabs to narrow the output.

Export or copy. Download the data as CSV or copy it to your clipboard for reporting, audits, or spreadsheets.

Because the tool separates one-word results from multi-word phrases, it is easier to spot when a keyword extraction pass is dominated by broad terms versus more specific search phrases.

Who it is for

ExtractKeywords is useful for people who need a fast keyword extraction tool without a complicated workflow.

SEO professionals who want to inspect a page's dominant terms or compare a competitor's page against their own.

Content creators and bloggers who want to check whether a draft naturally includes the terms they care about.

Researchers and students who need quick keyword extraction for document review or text analysis.

Digital marketers who want a lightweight way to audit landing pages or public content.

Anyone working in spreadsheets who wants CSV output from a keyword extraction run instead of manual note-taking.

It is especially useful when you need a quick read on a document or webpage and do not want to log in, install software, or set up a larger analytics stack.

ExtractKeywords is intentionally narrow in scope, and that is important to understand before relying on it. It performs keyword extraction based on frequency and phrase detection, so it does not claim to judge search intent, ranking potential, or content quality. A term can appear often without being the best SEO target, and a low-frequency phrase can still matter more strategically than the top result in a keyword extraction table.

The URL mode only works on publicly accessible pages, and the site says it respects robots.txt directives. If a page blocks access, requires a login, or does not expose usable text, the keyword extraction tool may fail or return incomplete results. The interface also shows an “AI PRO” label in the input area, but the harvested material does not explain a paid tier, so pricing details beyond the free use described on the site are unknown.

For editorial checks, brainstorming, and fast content audits, this keyword extraction tool is a good fit. For final SEO decisions, use it alongside search data, analytics, and official page sources rather than treating frequency alone as a ranking signal. ExtractKeywords is best as a quick keyword extraction helper, not as a replacement for deeper research or source verification.
